

Major interest in the Vacuum Etching Technology

As the years ago, Pill was present in Novembre 2005 on the Productronica in Munich and on Mai 2006 on the JPCA-Show in Seoul.

As expected, the major interest applied to the Vacuum Etching Technology, which could be presented this year impressively with a functional exhibit. Demonstrated was a Printed Circuit board inside the Vacuum etching module, sprayed on the top side with the Vacuum system alternately switched on and off, making the advantages of this technique clearly visible. Quite surprising for many interested ones who found themselves rather impressed.

In comparison to the last year, which was characterized by a certain restraint due to SARS, the number of visitors was significantly higher again, whereby most of them could be recorded on the second day (Thursday) of the show. The NPI presentations on Friday morning were noticeably better visited than in the previous year as well.
